CLIMATE SCIENCE BASICS

SIMPLY PUT BY DR. KIMBERLY NICHOLAS

IT'S WARMING.

HOTTEST YEARS IN RECORDED HISTORY!

2016, 2015, 2017, 2018, and 2014 were the hottest years on record. Even a small increase in average global temperatures could mean the difference between life and death for most life on Earth.

IT'S US.

WE ARE RESPONSIBLE FOR OUR OWN PROBLEM.

Humans are causing climate change by continually burning fossil fuels. There is a direct correlation between the release of greenhouse gases and rising temperatures worldwide.

WE'RE SURE.

THERE IS NO DEBATE AMONG SCIENTISTS.

97% of scientists agree that humans are causing increasingly escalating climate change with the emissions of greenhouse gases. These emissions have increased over the past 30 years.

IT'S BAD.

Devastating impacts have already included: extreme heat, stronger storms, fires, droughts, sea level rise, melting of glaciers and permafrost, ocean warming & acidification, and many human health effects.

WE CAN FIX IT.

BUT WE MUST ACT NOW!

We must keep fossil fuels in the ground. We must transition to renewable energy, of which there are now reliable sources. We must put pressure on our leaders to act NOW! Join in and take action to save the planet. It's the only one we have..

MAKE THE CASE FOR RENEWABLES!
